	Individual School Forecast by Enrollment	26

INTRODUCTION

The Davis Joint Unified School District has contracted with Davis Demographics & Planning, Inc. (DDP) to update and analyze demographic data relevant to the district's facility planning efforts. The scope of contracted work includes mapping the district, address matching the current student file, developing and researching pertinent demographic data, identifying future residential development plans and developing a five-year student population forecast. DDP will then assist the district in developing solutions for housing future student population. Additionally, this study was prepared to assist the district's efforts in evaluating future site requirements and attendance area changes.

The purpose of this report is to identify and inform the district of the trends occurring in the community; how these trends may affect future student population; and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts. The district can then use this information to better plan for the need, location and timing of facility or boundary adjustments.

The **Sources of Data** section details where the two sources of data, geographic and non-geographic, are collected and how each data item is utilized in the Five-year student population forecast model.

The **Five-Year Forecast Methodology** section discusses in detail how the factors used in the study were calculated and why they were used. These factors include: the calculation of incoming kindergarten classes, additional students from new housing (referred to as student yield), the effects of student mobility, and a detailed review of planned residential development within the district.

The **District Student Resident Forecast Summary** sections review the Fall 2021/22 student resident forecast results. Included in these sections are a district wide student population forecast summary and a projected resident student population summary for each existing attendance area and study area.

While reading this report, it is important to remember that this is a snapshot of current and potential student population based upon data gathered in Fall 2021/22. Population demographics change, development plans change, funding opportunities can change, District priorities can change, and therefore, new forecasts and adjustments to the overall Master Plan will continue to be necessary in the future.

SOURCES OF DATA

Geographic Map Data

Four geographic data layers were updated for use in the five-year student population forecasts:

1. Street Centerline Database
2. Study Areas
3. Schools
4. Students – Historical and Current

1) Street Centerline Data

DDP has licensed a digital street centerline map of the School District from ETAK. The street database has associated attributes that contain, but are not limited to, the following fields: full street name, address range and street classification

The main function of the streets is in the geo-coding process of the student data. Each student is address matched to the streets by their given address. The geo-coding process places a point on the map for every student in the exact location of student residence. This enables DDP to analyze the student data in a geographic manner.

Another vital utilization of the digital street database is in the construction of study areas. Freeways, major streets and neighborhood streets are used as boundaries for the study areas.

2) Study Areas

Study areas are small geographic areas and the building blocks of a school district; they are like neighborhoods. Study areas are geographically defined following logical boundaries of the neighborhood, such as freeways, streets, railroad tracks, rivers, etc. Each study area is then coded with the elementary, junior high and high school that the area is assigned to attend. By gathering information at the study area level, a school district can closely monitor growth and demographic trends in particular regions and spot potential need for boundary changes or new facilities.

3) Schools

The district provided school facility location information to DDP for the purpose of mapping the district facilities.

4) Student Data

a. Historical Student Data - Historical enrollment is used to compare past student population growth and trends as well as the effects of mobility (move-in, move-out from existing housing) throughout the district. DDP utilized the 3 previous years' (2018/19, 2019/20 and 2020/21) address matched students as historical data.

b. Current Student Data - A student data file geocoded October 6th, 2021, summarized by grade level and by study area is used as a base for enrollment forecasts. Existing students are categorized by study area through the address matching process that locates each student within a particular area based upon their given address. The forecasts run each of the next five years from fall 2022/23 through fall 2026/27.

The Student Accounting Summary (Table 1) indicates the total student enrollment as of October 6th, 2021, and the number of students used in the five-year student population forecasts. The forecast model is based upon student residence and excludes students residing outside of the district's boundaries, students unable to be address matched and Independent Study students.

Student Accounting Summary Students Used in Forecast	
Total Students Provided by District	8,297
Resident Students In Forecast	
Resident DJUSD Students	6,752
Resident DVCA Students	359
Total Resident Students in Forecast	7,111
Other Students In District Summary	
DJUSD Students (Non-Resident)	971
DVCA (Non-Resident)	215
Total Other Students in District Summary	1,186
Total Students in Forecast	
Total Resident Students in Forecast	7,111
Total Other Students in District Summary	1,186
Total Students Provided by District	8,297

Non-Geographic Data

Two basic sets of non-geographic data were compiled and reviewed for use in the five-year student population forecasts by residence:

1. Births by Zip Code
2. Mobility Factors

1) Births by Zip Code Data - Birth data by postal zip code, obtained from the California State Department of Health, for the years 1994-2019 and roughly correlated to the Davis Joint Unified School District. Past changes in historical birthrates are used to estimate incoming kindergarten student population from existing housing.

2) Mobility Factors - Mobility refers to the increase/decrease in the migration of students within the district boundaries (move-in/move-out of students from existing housing). Mobility, like a cohort, is applied as a percentage of increase/decrease among each grade for every year of the forecasts

FIVE YEAR FORECAST METHODOLOGY

The forecast methodology used in this study combines historical student population figures, past and present demographic characteristics, and planned residential development to forecast future student population at the study area level. District-wide forecasts are summarized from the individual study area forecasts. **These forecasts are based on where the students reside and their school of residence. DDP utilizes, the actual location of where the students reside, as opposed to their school of enrollment, to provide the most accurate estimate of where future school facilities should be located.** The best way to plan for future student population shifts is to know where the next group of students will reside. The following details the methodology used in preparing the student population forecasts by residence.

Five-Year Forecasts

Forecasts are calculated out five years from the date of forecast for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Five years are sufficient to plan for a student population shift and facility restructuring. It is a short to midterm solution for planning needs. Forecasts beyond Five years are based on speculation due to the lack of reliable information on birthrates, new home construction, economic conditions etc.

Why Forecasts are Calculated by Residence

Typically, school district forecasts are based on enrollment by school. However, this method is inadequate when used to locate future school facility requirements, because the location of the students is not taken into consideration. A school's enrollment can fluctuate due to variables in the curriculum, program changes, school administration and open enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

The method used by DDP is unique because it modifies a standard cohort forecast with demographic factors and actual student location. **DDP bases its forecasts on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside.**

The following details the methodology used in preparing the student population forecasts.

1) Progression - Each year of the forecasts, 12th grade students graduate and continuing students progress through to the next grade level and kindergarten students start school. This normal progression of students is modified by the following factors:

2) Incoming Kindergarten – Live birth data, reported to the California State Department of Health, by the resident postal zip code of the mother is used to project the base incoming kindergarten class. Additional kindergarten students may be added from future development. DDP uses birth data by zip code so, if necessary, a different birth factor can be applied to various areas of the district.

Incoming kindergarten classes, for existing homes, are estimated by comparing changes in past births and birthrates. Table 2 shows the total births for each zip code in the Davis Joint Unified School District from 1994 to 2020. Future kindergarten classes (2022/23-2026/27) are estimated by multiplying the existing kindergarten class (2021/22) by the ratio of the projected year's births to the 2016 births. Assuming the fall 2021/22 kindergarten class was born in 2016, DDP compared the total births in 2016 to the total births in 2017 to determine a factor for next year's kindergarten class (fall 2022/23). Similarly, 2016 was compared to 2018 (fall 2023/24 K class), 2016 to 2019 (fall 2024/25 K class) and 2016 to 2020 (Fall 2025/26 K class).

Births by Zip Code				Birth Rate	
Birth Year	Kinder Year	95616 and 95618	% Change*	Birthrate Used in Forecast	School Year
1994	1999	565	111.9%		1999/00
1995	2000	555	109.9%		2000/01
1996	2001	555	109.9%		2001/02
1997	2002	548	108.5%		2002/03
1998	2003	591	117.0%		2003/04
1999	2004	581	115.0%		2004/05
2000	2005	637	126.1%		2005/06
2001	2006	637	126.1%		2006/07
2002	2007	622	123.2%		2007/08
2003	2008	632	125.1%		2008/09
2004	2009	600	118.8%		2009/10
2005	2010	556	110.1%		2010/11
2006	2011	607	120.2%		2011/12
2007	2012	558	110.5%		2012/13
2008	2013	580	114.9%		2013/14
2009	2014	533	105.5%		2014/15
2010	2015	496	98.2%		2015/16
2011	2016	483	95.6%		2016/17
2012	2017	524	103.8%		2017/18
2013	2018	497	98.4%		2018/19
2014	2019	488	96.6%		2019/20
2015	2020	531	105.1%		2020/21
2016	2021	505	Base Year		2021/22
2017	2022	475	94.1%	1.080	2022/23
2018	2023	428	84.8%	1.060	2023/24
2019	2024	395	78.2%	1.040	2024/25
2020	2025	382	75.6%	1.020	2025/26
2021	2026	Birth Data was not available at the time of study.	NA	1.000	2026/27

** Due to the Covid-19 Pandemic there was an unpredicted decline in kindergarten enrollment. Because the forecast model utilizes the current year's (2021/22) kindergarten resident population to estimate future kindergarten resident population, a modified birth rate was used for future years. Through discussion with district staff, it was decided to use 1.1 to 1.02 for the forecasted resident kindergarten population. This will keep the future kindergarten resident population near the average of the last five years.

Table 2- Birth Data

* % Change refers to the change in total births for each year compared to the base year.

Source: California Department of Health Statistics

3) Student Mobility Factors - Student mobility factors further refine the ten-year student population forecasts. Mobility refers to the increase/decrease in the migration of students within the district boundary (move-in/move-out of students from existing housing). Mobility, like a cohort, is applied as a percentage to each grade for every year of the forecasts.

A net increase or decrease of zero students over time is represented by a factor of 100%. A net student loss is represented by a factor less than 100% (1.00) and a net gain by a factor greater than 100% (1.00) (see example).

Having historical student data categorized by study area is extremely helpful in calculating accurate Student Mobility Factors. The sampling used was taken over a four-year period (student data from 2017/18 through 2021/22) and three yearly groupings were calculated. For example, a comparison was made for the fall 2017/18 K student population to the fall 2018/19 1st grade students. This comparison was also conducted for the fall 2018/19 & fall 2019/20, and the fall 2019/20 & fall 2021/22 students.

Attendance Area	K to 1	1 to 2	2 to 3	3 to 4	4 to 5	5 to 6	6 to 7	7 to 8	8 to 9	9 to 10	10 to 11	11 to 12
Birch Lane ES	1.00	1.04	1.00	1.00	0.99	0.96	0.97	1.02	1.00	1.00	1.01	1.01

Willett ES	1.03	1.07	0.95	0.93	0.94	0.98	1.00	0.96	0.97	1.01	0.94	0.97

Table 3—Mobility

4) Planned Residential Development –Planned residential development data is collected to determine the number of new residential units that will be built over the five-year timeframe of the student population forecasts. The projected units within the next ten years will have the appropriate Student Yield Factor, Table 4, applied to them to determine the number of new students planned residential development will yield.

This data was obtained through discussions with the major developers within the district boundaries, the planning department of the City of Davis, the planning department of Yolo County, planning officials at U.C. Davis and District officials. A database map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move-in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments.

In the student population forecast by residence DDP includes all approved and tentative tract maps in addition to any planned or proposed development that may occur within the forecast timeframe. The planned residential development information and phasing estimates is a snapshot of the district at the time of this study. All the Information may change and should be updated annually (see Table 5 next page).

5) Student Yield Factors – Five-Year Forecasts - Closely related to the planned residential development units are Student Yield Factors. The Student Yield Factors, when applied to planned residential development units, determine additional students generated from new construction within the district.

Student Yield Factors - District Wide*			
Type	K-6 Yield	7-8 Yield	9-12 Yield
SFD	0.265	0.082	0.102
MFA	0.104	0.061	0.017
APT	0.147	0.047	0.037

Table 4—Student Yield Factors

*Note: Student Yield Factors were calculated from the Verona development.

RESIDENTIAL DEVELOPMENT LIST

Project Name	Study Area	Type	Total Units	Developer	City Approval	Student Housing	Status	Years Until Buildout	Included in Forecast

Table 5– Planned Residential Development

Note: The development list includes projects that occupancy will begin in the five-year period of the enrollment forecasts. Future projects may not be included if they do not fall in this period. Total Units reflect the number of approved units for the project not the remaining units to be built. Not all units are used in the forecast due to focus on college students with few school age children expected to move in.

APPLYING THE VARIABLES TO GENERATE THE FORECASTS

The following paragraphs summarize how DDP uses the factors to determine the student population forecasts. Remember that these forecasts are based on residence.

The Davis Joint Unified School District has been broken up into 247 study areas and each study area is coded for the elementary, junior high and high school attendance area in which it falls. The residential forecasts are calculated at the study area level. This means that DDP conducts 247 individual forecasts that are based upon the number of students residing in each study area.

The first step in running these forecasts involve listing the number of students that live in a particular study area by each individual grade (kindergarten through 12th grade). The current student base (Fall 2021/22) is then passed onto the next year's grade (2021/22's K become 2022/23's 1st graders, 2021/22's 1st graders become 2022/23's 2nd graders, and so on). After the natural progression of students through the grades is applied, then Birth Factors are multiplied by the current kindergarten class to generate a base for the following year's kindergarten class. Discussion on Transitional Kindergarten methodology is on page 4.

Next, a Mobility Factor is applied to all grades. Again, these factors consider the natural in/out migration of students throughout the district.

The last essential layer applied to the forecasts deals with additional students from planned residential development. This is a simple calculation, again conducted at the study area level, where the estimated number of new housing units for a particular year is multiplied by the appropriate Student Yield Factors. For example, if 100 single family detached (SFD) units are to be built in a specific study area each year, then you would multiply this number (100) by the SFD K-6 student yield factor (.265) and the resulting number of students (26.5) is divided evenly among the seven grades.

To finish generating the forecasts by residence, the same process is conducted for each of the 247 study areas. Once the forecasts have been run at the study area level, then it is simple addition to determine forecasts for each of the district's attendance areas or for a district-wide summary. For example, the student population forecasts for Davis Senior High School are simply the summary of all the study areas that make up this specific attendance area.

The District Summary for the forecasts (Section 3) is a total summary of all 247 study areas, which excludes all the students that attend a District school but live completely outside of the district's boundaries, are unmatched due to incorrect address information and independent study students. These out-of-district, unmatched and independent study students are factored back into the forecasts by simply adding the existing totals in at the bottom of the forecasts (please see the Attendance Matrices in Section 2 for a breakdown of the out-of-district, unmatched and independent study students by school). DDP adds the current total out-of-district, unmatched students and independent study students to each year of the forecasts because there is no way to accurately forecast these students in the future.

ATTENDANCE MATRICES

Three attendance matrices have been included to provide a better understanding of where students reside and where they attend school. **Remember, DDP forecasts are based upon where the students reside, not where they attend school. DDP uses the actual location of where the students reside, as opposed to their school of enrollment, to provide the most accurate prediction of future facilities adjustments.** Therefore, since the forecasts are based upon where the students reside, the figures used as a base for each school's resident forecast may differ from the actual reported enrollment for each school.

These attendance matrices function as check and balance for student accounting. They show where the students reside (in what School of Residence) based upon our address matching capabilities and what school they attend (School of Attendance) based upon data in the student file supplied by the district. The inclusion of these matrices is essential to showing how the students used in the forecasts match up to the district's records of enrollment for each school. The best way to plan for future facilities changes is to know where the next group of students will be residing, not necessarily which school they are currently attending.

READING THE MATRIX

Looking at the TK-6 Elementary School Attendance Matrix below, let us begin with Birch Lane as an example. Following down the first column with the Birch Lane heading, there are 289 TK-6 grade students who attend Birch Lane *and* reside in the Birch Lane attendance area. Continuing downward, 50 students attend Birch Lane that resides in the Korematsu attendance area. Next the matrix shows that 71 students attend Birch Lane and reside in the North Davis ES attendance area, and so on.

The row Out of District refers to students who live completely outside of the Davis Joint Unified School District but attend one of the district's schools. There are 74 Out of District students attending Birch Lane. Total Attendance shows the total number of students attending a school regardless of where they reside and reflects the district's enrollment counts for each school. There are a total of 531 students attending Birch Lane.

The next step is to read across the matrix, beginning with the Birch Lane attendance area row. We understand that the 289 represents the total number of TK-6 grade students that reside in the Birch Lane attendance area and attend Birch Lane. The next column, Korematsu, refers to the number of TK-6 grade students that reside in the Birch Lane attendance area, but attend Korematsu. There are currently 43 students that reside in the Birch Lane attendance area and attend Korematsu.

The Total Residence column is the total number of students living in each attendance area. There are 509 K-6 students residing in the Birch Lane attendance area. The Total Attendance row is the actual number of students used as the base or actual number for each attendance area in the Fall 2021/22 forecasts

SCHOOL OF RESIDENCE	SCHOOL OF ENROLLMENT										
	Attendance Area	Count of Students Living in Attendance Area	Birch Lane ES	Korematsu ES	North Davis ES	Patwin ES	Pioneer ES	Willett ES	Chavez ES	Davis School Independent Study	Fairfield School
	Birch Lane ES	509	289	43	21	7	3	24	62	19	3

FIVE YEAR FORECAST SUMMARIES

Finally, the student population is projected out five years for each of the study areas and for the entire Davis Joint Unified School District. The District Wide forecast summaries enable the district to see a broad overview of future student population and what impact this population will have on existing facilities. The study area listings enable the district to monitor student population growth or decline in smaller geographic areas within the district.

At any point in time, study areas and their projected resident students can be moved between schools to assist in balancing enrollment changes. Together, these forecast summaries present the means to identify the timing of student arrivals and overall facility requirements, as well as location to accommodate the district's expected population shift.

SCHOOL FORECAST BY ENROLLMENT

SchoolSite Forecasts by Enrollment is a way to ensure your district has the appropriate staff to fulfill future classroom requirements. SchoolSite Forecasts by Enrollment utilize current resident and enrollment information, as well as historic student mobility to calculate an estimated enrollment for each school. This method of strategic and planned staffing can help to evaluate the current state of facilities, as well as their future needs.

Please Note:

Due to lack of historic enrollment information for new boundaries along with the unknown nature of student choice, forecasting enrollment after boundary changes, new schools and grade configuration changes is exceedingly difficult and can lead to inaccurate results. These forecasts are based upon best knowledge and assumptions.

Two-Year Staffing Forecasts

Mid-term to long-term facilities planning is always best when it is based upon the resident location of future student populations, rather than the enrollment at the individual schools. However, a two-year projected enrollment can be used to assist with estimating staffing and budget requirements over the short term.

Methodology for Schools with Attendance Boundaries

Calculating a staffing Forecast for schools with attendance boundaries is different from calculating it for a school without attendance boundaries. For school with attendance boundaries, the two-year projected enrollment is calculated using a combination of future resident population and historic transfer patterns for each school.

Like the mobility factors in the residence Forecasts, a cohort is derived by averaging four years of past transfer patterns. The cohort is calculated for both transfers into and out of each school for each grade between 1 and 12 that the school serves. This cohort is then applied to the current transfer by grade of the base year students to come up with estimated in and estimated out transfers for the future years. To estimate the transfers in and transfers out for the lowest grade served at each school, an average is taken of the last four years of transfers. Finally, projected enrollment by grade for each school is calculated by taking the projected resident population and adding the estimated transfers in and transfers out.

Methodology for Schools without Attendance Boundaries (Schools of Choice)

To calculate a staffing Forecast for schools without attendance boundaries, a different method of calculation is used. Transfers in and transfers out for the lowest grade served at each school are estimated by taking an average of the last four years of transfers. Each subsequent grade is calculated using the non-weighted cohort survival method and applied to the current year's enrollment.
